FUNCTION: Converts the abundant, but inactive, zymogen plasminogen to plasmin by hydrolyzing a single Arg-Val bond in plasminogen. By controlling plasmin-mediated proteolysis, it plays an important role in tissue remodeling and degradation, in cell migration and many other physiopathological events. CATALYTIC Specific cleavage of Arg-|-Val bond in plasminogen to form plasmin.

SUBJUIT: Heterodimer of chain A and chain B held by a disulfide

This SWISS-PROT entry is copyright. It is produced through a collaboratio between the Swiss Institute of Bioinformatics and the EMBL outstation the Buropean Bioinformatics Institute. There are no restrictions on it use by non-profit institutions as long as its content is in no wa modified and this statement is not removed. Usage by and for commercia entities requires a license agreement (See http://www.isb-sib.ch/announce or send an email to license@isb-sib.ch). bond.

-1- SUBCELLULAR LOCATION: Secreted, extracellular.

-1- SUBCELLULAR LOCATION: Secreted, extracellular.

-1- FTM: THE SINGLE CHAIN, ALMOST FULLY ACTIVE ENZYME, CAN BE FURTHER PROCESSED INTO A TWO-CHAIN FULLY ACTIVE FORM BY A CLEAVAGE AFTER ARG-308 CATALYZED BY PLASMIN, TISSUB KALLIKREIN OR FACTOR XA.

-1- SIMILARITY: Binds to the kringle structure of the fibrin A chain. Binding to fibrin enhances its catalytic activity.

-1- SIMILARITY: Contains I Egg-like domain.

-1- SIMILARITY: Contains I fibronectin type I domain.

-1- SIMILARITY: Contains 2 kringle domains.

"Catalytic domain structure of vampire bat plasminogen activator: a
molecular paradigm for proteolygis without activation cleavage.";

molecular paradigm for proteolygis without activation cleavage.";

Elochemistry 36:1343-1343(1991).

"Le HUNCTION: Probably essential to support the feeding habits of this exclusively hematophagous animal. Potent thrombolytic agent.

"CATALYIZ ACTIVITY: Specific cleavage of Arg-|-Val bond in plasminogen to form plasmin.

"ENZYMEN REGULATION: Activity toward plasminogen is stimulated in the presence of fibrin I.

"ENZYMEN The fibronectin type-I domain mediates binding to fibrin, and the kringle domain apparently mediates fibrin-induced stimulation of activity.

"SIMILARITY: Contains I EGF-like domain.

"SIMILARITY: Contains I fibronectin type I domain.

"SIMILARITY: Contains I fibronectin type I domain.

"SIMILARITY: Contains I kringle domain. This SWISS-PROT entry is copyright. P SEQUENCE OF 40-655 FROM N.A.

SEQUENCE OF 40-655 FROM N.A.

Zhao S., Odell C.;

Submitted (FEB-1996) to the EMBL/GenBank/DDBJ databases.

Converting it from a single chain to a heterodimeric form.

C -1- FUNCTION: Activates hepatocyte growth factor (HGF) by converting it from a single chain to a heterodimeric form.

C -1- SUBMIT: Dimer of a short chain and a long chain linked by a disulfide bond.

C -1- SUBCELLULAR LOCATION: Secreted as an inactive single-chain precursor and is then activated to a heterodimeric form.

C -1- SIMILARITY: Contains 1 fibronectin type I domain.

C -1- SIMILARITY: Contains 1 fibronectin type II domain.

C -1- SIMILARITY: Contains 1 kibronectin type II domain.

C -1- SIMILARITY: Contains 1 kibronectin type II domain.

C -1- SIMILARITY: Contains 1 kibronectin type II domain.

C -1- SIMILARITY: Contains 1 kindle domain.

C -1- CAUTION: It is uncertain whether Met-1 is the initiator.

- PTM: N- and O-glycosylated. The N-glycans are complex biantennary structures present in either a mono- or disialylated state. The O-glycans are mostly (80%) represented by the monosialylated core type I structure, Neuklacalpha2-3Galbeta1-3GalNAc, with smaller amounts of disialylated and non-sialylated O-glycans also
- detected.
  --- DISRAE: Elevated plasma concentrations of apo(a) and its naturally occurring proteolytic fragments are correlated with anternally occurring proteolytic fragments are correlated with atherosclerosis. Homology with plasminogen kringles IV and V is thought to underlie the atherogenicity of the protein, because the fragments are competing with plasminogen for fibrin (ogen) binding.
  --- MISCELLANBOUS: Apo(a) is known to be proteolytically claeved, leading to the formation of the so called mini.Lp(a). Apo(a) fragments accumulate in atherosclerotic lesions, where they may promote thromogenesis. O-glycosylation may limit the extent of proteolytic fragmentation.
  --- SIMILARITY: Belongs to peptidase family S1. Plasminogen subfamily. <u>-</u>-

Pur. J. Biochem. 193:57-63 (1988).

Pur. J. Biochem. Plasmin dissolves the fibrin of blood clots and acts as a proteolytic factor in a variety of other processes including embryonic development, tissue remodeling, tumor invasion, and inflammation; in ovulation it weakens the walls of the Graafian follicle. It activates the urokinase-type plasminogen activator, collagenases and several complement zymogens, such as CI and CS. It cleaves fibrin, fibronectin, thrombospondin, laminin and von Willebrand factor.

Public Schartzic Activity: preferential cleavage: Lys-|-Xaa > Arg-|-Xaa, higher selectivity than trypsin. Converts fibrin into soluble

 -!- ENZYME REGULATION: Converted into plasmin by plasminogen activators, both plasminogen and its activators being bound to fibrin. Cannot be activated with streptokinase.
-!- MISCELLANEOUS: Plasmin is inactivated by alpha-2-antiplasmin immediately after dissociation from the clot.
-!- SIMILARITY: Belongs to opptidase family S1. Plasminogen subfamily.
-!- SIMILARITY: Contains 5 kringle domains.

J. Biol. Chem. 264:5957-5965(1989).

J. PUNCTION: Plasmin dissolves the fibrin of blood clots and acts as a proteolytic factor in a variety of other processes including embryonic development, tissue remodeling, tumor invasion, and inflammation; in ovulation it weakens the walls of the Graafian follicle. It activates the uroxinase-type plasminogen activation follicle. It cleaves fibrin, fibronectin, thrombospondin, laminin and von Willebrand factor.

J. CAPALYTIC ACTIVITY: Preferential cleavage: Lys- - Xaa > Arg- - Xaa, higher selectivity than trypsin. Converts fibrin into soluble

1. SUBCELLULAR LOCATION: Type I membrane protein.

1. SUBCELLULAR LOCATION: Type I membrane protein.

1. DEVELOPMENTAL STAGE: Expressed at high levels during early embryonic development. The expression levels during strongly around day 16 and there are only very low levels in adult tissues.

1. DISEASE: Défecté in ROR2 are a cause of brachydactyly type B1 disorder characterized by hypoplasia/aplasia of distal phalanges and and mails. In BDB1 the middle phalanges are short but in addition the terminal phalanges are rudimentary or absent. Both fingers and toes are affected. The thumbs and big toes are usually deformed.

1. DISEASE: Défecte in ROR2 are a cause of recessive Robinow syndrome (RRS) (MIN:26810). RRS is an autosomal disorder characterized by skeletal dysplasia with generalized limb bone shortening, segmental defects of the spine, brachydactyly and a dysmorphic

 TYROSINE-PROTEIN KINASE TRANSMEMBRANE
RECEPTOR ROR2.
EXTRACELLULAR (FOTENTIAL).
POTENTIAL.
CYTOPLASMIC (POTENTIAL).
 SÚBCELLULÂR LÔCATION: Type I membrane protein.
SIMILARITY: Belongs to the Tyr family of protein kinases. ROR
in the early formation of the chondrocytes. It seems to be required for cartilage and growth plate development. CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + protein tyrosine phosphate.
 subfamily.
--- SMILARITY: Contains 1 frizzled (FZ) domain.
--- SIMILARITY: Contains 1 immunoglobulin-like C2-type domain.
---- SIMILARITY: Contains 1 kringle domain.

Complete amino acid sequence of canine miniplasminogen.";
"Complete amino acid sequence of canine miniplasminogen acid acid a proteolytic factor in a variety of other processes including embryonic development, tissue remodeling, tumor invasion, and inflammation; in ovulation it weakens the walls of the Graafian follacle. It activates the urckinase-type plasminogen activator, collagenases and several complement zymogens, such as C1 and C5.
It claaves fibrin, fibronectin, thrombospondin, laminin and von Willebrand factor.

C.:-CATALYTIC ACTIVITY: Preferential cleavage: Lys-|-Xaa > Arg-|-Xaa;
C.:-CATALYTIC ACTIVITY: Preferential cleavage: Lys-|-Xaa > Arg-|-Xaa;

The invention relates to a composition comprising one or more domains of urokinase-type plasminogen activator (uPA). The composition is used to modulate the contractility and angiogenic activity of a mammalian muscle, endothelial cell or tissue. The composition is used for treating stroke, hypotension, hypertension, atherosclerosis, heart attack, microvascular occlusions, thrombotic microangiopathies, surgically induced thrombotic disorders, angiogenic disorders, upulmonary fibrosis, asthma, tumour cell angiogenesis, tumour cell metastasis, glaucoma, invasion, tumour cell angiogenesis, tumour cell metastasis, glaucoma, clasorderic retinopathy, wound healing, clotting disorder, uterine contraction disorder, male impotence, respiratory disease or condition such as asthma, adult respiratory distress syndrome, primary pulmonary hypertension, microvascular thrombotic occlusion, and a disorder sequence is human urokinase-type plasminogen activator (uPA) amino terminal fragment (ATF) and connecting peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1 SNELHÖVPSNCDCLNGGTCVSNKYFSNIHWCNCPKKFGGGHCEIDKSKTCYEGNGHFYRG

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  8
                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a composition comprising one or more domains of urckinase-type plasminogen activator (uPA). The composition is used to modulate the contractility and angiogenic activity of a mammalian muscle, endothelial cell or tissue. The composition is used for treating stroke, hypotension, hypertension, atherosclerosis, heart attack, microvascular occlusions, thrombotic microangiopathies, surgically induced thrombotic disorders, angiogenic disorders, pulmonary fibrosis, asthma, tumour cell angiogenesis, tumour cell metastasis, glaucoma, invasion, tumour cell angiogenesis, tumour cell metastasis, glaucoma, clasorder, male impotence, respiratory disease or condition such as asthma, adult respiratory diserses syndrome, primary pulmonary hypertension, microvascular thrombotic occlusion, and a disorder sequence is human urokinase-type plasminogen activator (uPA) amino
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          strokė, hypotension, atherosclerosis, heart attack; thrombotic disorder; microvascular occlusion, angiogenic disorder; pulmonary fibrosis, asthma, tumour cell metastasis; glaucoma; diabetic retinopathy; wound healing; clotting disorder; uterine contraction disorder; respiratory disease;

AAH32943 to AAH37195 and AAG73514 to AAG77788 represent human colon cancer-associated mucleic acid melecules (N) and proteins (P), where the proteins are collectively known as colon cancer antigens. The colon cancer antigens have cytostatic activity and can be used in gene therapy and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders associated with decreased care expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps, by inserting the mucleic acids into a host cell and culturing the cell to express the proteins. N and P can be used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. AAH37196 to AAH37704 and AAB7779 represent carcinomas and cancers. AAH37196 to AAH37704 and AAB7779 represent pages 666 to 682 and page 7053 of the sequence listing were missing at time of pubblication, meaning no sequences are present for SBQ ID NO:1027 to 1052
                                                                                                                                                                                                                                                                                                                       Nucleic acids encoding 4277 human colon cancer-associated polypeptides, useful for preventing, diagnosing and/or treating colorectal cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SEQ ID NO:2927.

```

The invention relates to 2175 novel human ovarian antigens (ABP41054-CC ABP43228) and to cDNAs encoding them (AB954131-AB956305), and also encompasses polypeptides 90% identical and polymocleotides 95% identical to the sequences of the invention. The invention additionally relates to recombinant vectors and host cells comprising human ovarian antigens, and the use of ovarian antigens, and the use of ovarian prognosing or preventing various ovary and/or breast-related disorders. Such conditions include ovarian cancer and breast cancer, and metastatic tumours of ovarian or breast origin, reproductive system disorders (e.g., infertility, disorders of pregnancy, anovulation, calsorders (e.g., infertility, disorders of pregnancy, anovulation, polycystic ovary syndrome, ovarian cysts, and dysmenorrhoea), endocrine disorders, infertility, disorders (e.g., mastitis, oophoritis and captured; shock syndrome), inflammatory conditions (e.g., mastitis, oophoritis and vaginately, immune disorders (e.g., congenital and acquired.

Shock syndrome), inflammatory conditions (e.g., mastitis, oophoritis and vaginated disorders (e.g., anaemia), cardiovascular disorders.

Confortalated disorders (e.g., anaemia), cardiovascular disorders.

Confortalated disorders. Ovarian antigen polypeptides may also be used in screening for compounds which modulate ovarian antigen expression or activity. The polynucleotides may also be used in screening for compounds which continue represents a human ovarian antigen of the printed

The composition is used to modulate the contractility and angiogenic activity of a mammalian muscle, endothelial cell or tissue. The composition is used for treating stroke, typotension, hypertension, atherosclerosis, heart attack, microvascular occlusions, thrombotic microangiopathies, surgically induced thrombotic disorders, angiogenic disorders, tumour cell metastasis, glaucoma, invasion, tumour cell angiogenesis, tumour cell metastasis, glaucoma, disorders range and healing, clotting disorder, uterine contraction disorder, male impotence, respiratory disease or condition such as asthma, adult respiratory distress syndrome, primary pulmonary hypertension, microvascular thrombotic occlusion, and a disorder sessoriated with chronic intrapulmonary fibrin formation. The present sequence is human urokinase-type plasminogen activator (uPA) single chain urokinase-type plasminogen as scuPA deltal36-143

Zymogen AAP50871 is the inactive precursor form of human urokinase. Urokinase zymogen is cleaved into the two-chain form composed of characteristic urokinase H (molecular wt.of 30,000) and L (molecular wt.of 20,000) chains when treated with catalytic amounts of plasmin. The patentors claim a new urokinase zymogen which has mol. wt. ca. 50,000, a single chain molecular structure, and selective affinity for fibrin. It is a thrombolytic agent which manifests its plasminogen activator activity on cleavage by proteolytic enzymes (e.g. plasmin) and has higher affinity for fibrin than known forms of urokinase

The derivative has decreased susceptibility to thrombin compared to natural type pro-UK and higher specific activity. See also AAQ10168 and AAQ10170

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New variants of human prourokinase (hPUK) comprise a hPUK deficient in (i) at least part of the first loop region of the epidermal growth factor (EGF) domain; (ii) at least part of the first loop and at least part of the second loop; or (iii) at least part of the third loop. The hPUK variants show an increased blood half-life comparable to that of the same properties as those of hPUK. They have potent thrombolytic activity and very little tendency to cause spontaneous bleeding. The present sequence is that of the wild-type hPUK protein, including the EGF domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               61 KASTDIMGRPCLPWNSAIVLQQIYHAHRSDALQLGLGKHNYCRNPDNRRRPWCYVQVGLK 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human pre-urokinase can be modified by replacing: Ser, Asn, Pro, Gly, or Tyr in the region ranging from residue 10 to 60 in the N-terminal of the human PUK by Thr, Pro or Ala. These mutants have a longer half-life in the blood and a higher thrombolytic ability. For examples see (AARA7956-R47960)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Mutant human pre:urokinase - by replacing specified aminoacid(s) in N-terminal for providing longer half-life in blood and higher thrombolytic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1 SNELHQVPSNCDCLNGGTCVSNKYFSNIHWCNCPKKFGQQHCEIDKSKTCYEGNGHFYRG

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAR62991 is the wild type pro-urokinase, from which the new mutants described in AAR62992-R63008 were derived. These mutants retain the thrombolytic activity of the wild type protein, useful for the treatment of thromboembolism, but have a reduced fibrinogenolysis activity and nonspecific plasminogen activation. The mutants can therefore be used for the lysis of fibrin clots without inducing systemic bleeding, as can be the case with the wild type protein. (Updated on 25-MAR-2003 to correct by field.)
                                                                                                                                                    reduced fibrinogenolysis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1 SNELHQVPSNCDCLNGGTCVSNKYFSNIHWCNCPKKFGGQHCEIDKSKTCYEGNGHFYRG

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAR62991 is the wild type pro-urokinase, from which the new mutants described in AAR62992-R63008 were derived. These mutants recain the thrombolytic activity of the wild type protein, useful for the treatment of thromboembolism, but have a reduced fibrinogenolysis activity and nonspecific plasminogen activation. The mutants can therefore be used for the lysis of fibrin clots without inducing systemic bleeding, as can bette case with the wild type protein. (Updated on 25-MAR-2003 to correct by field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SNETHOVPSNCDCLNGGTCVSNKYFSNIHWCNCPKKFGGQHCEIDKSKTCYEGNGHFYRG

Pro-urokinase; thrombolysis; fibrin clot lysis; reduced fibrinogenolysis; non-specific plasminogen activation; systemic bleeding; mutant His 299 Ala300.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAR62991 is the wild type pro-urokinase, from which the new mutants described in AAR62992-R63008 were derived. These mutants retain the thrombolytic activity of the wild type protein, useful for the treatment of thrombolism, but have a reduced fibrinogenolysis activity and nonspecific plasminogen activation. The mutants can therefore be used for the lysis of fibrin clots without inducing systemic bleeding, as can be the case with the wild type protein. (Updated on 25-MAR-2003 to correct by field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Pro-urokinase mutants - have thrombolytic activity but reduced fibrinogenolysis activity and non-specific plasminogen activation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Length 411;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   793; DB 2;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAR62991 is the wild type pro-urokinase, from which the new mutants described in AAR62992-863008 were derived. These mutants retain the thrombolytic activity of the wild type protein, useful for the treatment of thromboembolism, but have a reduced fibrinogenolysis activity and nonspecific plasminogen activation. The mutants can therefore be used for the lysis of fibrin clots without inducing systemic bleeding, as can be the case with the wild type protein. (Updated on 25-MAR-2003 to correct
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SNELHQVPSNCDCLNGGTCVSNKYFSNIHWCNCPKKFGGQHCEIDKSKTCYEGNGHFYRG
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SNELHQVPSNCDCLNGGTCVSNKYFSNIHWCNCPKKFGGQHCEIDKSKTCYEGNGHFYRG

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAR62991 is the wild type pro-urokinase, from which the new mutants described in AAR62992-R63008 were derived. These mutants retain the thrombolytic activity of the wild type protein, useful for the treatment of thromboembolism, but have a reduced fibrinogenolysis activity and nonspecific plasminogen activation. The mutants can therefore be used for the lysis of fibrin clots without inducing systemic bleeding, as can be

                                                                                                      AAR62991 is the wild type pro-urokinase, from which the new mutants described in AAR62992-R63008 were derived. These mutants retain the thrombolytic activity of the wild type protein, useful for the treatment of thromboembolism, but have a reduced fibrinogenolysis activity and non-specific plasminogen activation. The mutants can therefore be used for the lysis of fibrin clots without inducing systemic bleeding, as can be the case with the wild type protein. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                            SNELHQVPSNCDCLNGGTCVSNKYFSNIHWCNCPKKFGGQHCEIDKSKTCYEGNGHFYRG
                                                                                                                                                                                                                                                                                                       SNEIHQVPSNCDCLNGGTCVSNKYFSNIHWCNCPKKFGGQHCEIDKSKTCYEGNGHFYRG
                                        Pro-urokinase mutants - have thrombolytic activity but reduced fibrinogenolysis activity and non-specific plasminogen activation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Pro-urokinase; thrombolysis; fibrin clot lysis; mutant Ala300; reduced fibrinogenolysis; non-specific plasminogen activation; systemic bleeding.
                                                                                                                                                                                                                                                     Length 411;

         AAR62991 is the wild type pro-urokinase, from which the new mutants the described in AAR62992-R63008 were derived. These mutants retain the thrombolytic activity of the wild type protein, useful for the treatment of thromboembolism, but have a reduced fibrinogenolysis activity and nonspecific plasminogen activation. The mutants can therefore be used for the lysis of fibrin clots without inducing systemic bleeding, as can be the case with the wild type protein. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      KASTDIMGRPCLPWNSAIVLQQIYHAHRSDALQLGLGKGNYCRNPDNRRRPWCYVQVGLK 120
                                                                                                                                                                                                           AAR62991 is the wild type pro-urokinase, from which the new mutants described in AAR62992-R63008 were derived. These mutants retain the thrombolytic activity of the wild type protein, useful for the treatment of thromboembolism, but have a reduced fibrinogenolysis activity and nonspecific plasminogen activation. The mutants can therefore be used for the lysis of fibrin clots without inducing systemic bleeding, as can be the case with the wild type protein. (Updated on 25-MAR-2003 to correct

                                                                                                                                                                                                                                                                                                   AAR62991 is the wild type pro-urokinase, from which the new mutants described in AAR62992-R63008 were derived. These mutants retain the thrombolytic activity of the wild type protein, useful for the treatment of thromboembolism, but have a reduced fibrinogenolysis activity and nonspecific plasminogen activation. The mutants can therefore be used for the lysis of fibrin clots without inducing systemic bleeding, as can be the case with the wild type protein. (Updated on 25-WAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1 SNELHQVPSNCDCLNGGTCVSNKYFSNIHWCNCPKKFGGQHCEIDKSKTCYEGNGHFYRG

AAR62991 is the wild type pro-urokinase, from which the new mutants described in AAR62992-R63008 were derived. These mutants retain the thrombolytic activity of the wild type protein, useful for the treatment of thromboembolism, but have a reduced fibrinogenolysis activity and nonspecific plasminogen activation. The mutants can therefore be used for the lysis of fibrin clots without inducing systemic bleeding, as can be the case with the wild type protein. (Updated on 25-MAR-2003 to correct Pro-urokinase mutants - have thrombolytic activity but reduced fibrinogenolysis activity and non-specific plasminogen activation. Claim 16; Fig 1; 46pp; English

Pro-urokinase mutant Ala300 Ala301.

Pro-urokinase, thrombolysis, fibrin clot lysis, reduced fibrinogenolysis, non-specific plasminogen activation; mutant Ala300 Ala301; systemic bleeding.

```

Pro-urokinase; thrombolysis; fibrin clot lysis; reduced fibrinogenolysis; non-specific plasminogen activation; systemic bleeding; mutant Ser175 His187 Gly306 Ala313.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAR62991 is the wild type pro-urokinase, from which the new mutants described in AAR62992-863008 were derived. These mutants retain the thrombolytic activity of the wild type protein, useful for the treatment of thromboembolism, but have a reduced fibrinogenolysis activity and non-specific plasminogen activation. The mutants can therefore be used for the lysis of fibrin clots without inducing systemic bleeding, as can be the case with the wild type protein. (Updated on 25-MAR-2003 to correct
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1 SNELHQVPSNCDCLNGGTCVSNKYFSNIHWCNCPKKFGGQHCEIDKSKTCYEGNGHFYRG

These mutants retain the thrombolytic activity of the wild type protein, useful for the treatment of thromboembolism, but have a reduced fibrinogenolysis activity and non-specific plasminogen activation. The mutants can therefore be used for the lysis of fibrin close without inducing systemic bleeding, as can be the case with the wild type protein. (Updated on 25-MAR-2003 to correct
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            9

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAR62991 is the wild type pro-urokinase, from which the new mutants described in AA62992-R63008 were derived. These mutants retain the thrombolytic activity of the wild type protein, useful for the treatment of thromboembolism, but have a reduced fibrinogenolysis activity and nonspecific plasminogen activation. The mutants can therefore be used for the lysis of fibrin clots without inducing systemic bleeding, as can be the case with the wild type protein. (Updated on 25-MAR-2003 to correct by field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Pro-urokinase mutants - have thrombolytic activity but reduced fibrinogenolysis activity and non-specific plasminogen activation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              100.0%; Score 793; DB 2; Length 411; 100.0%; Pred. These mutants retain the thromboltytic activity of the wild type protein, useful for the treatment of thromboembolism, but have a reduced fibringenolysis activity and nonspecific plasminogen activation. The mutants can therefore be used for the lysis of fibrin clots without inducing systemic bleeding, as can be the case with the wild type protein. (Updated on 25-MAR-2003 to correct by field.)

                  AAR62991 is the wild type pro-urokinase, from which the new mutants described in AAR62992-R63008 were derived. These mutants retain the thrombolytic activity of the wild type protein, useful for the treatment of thromboembolism, but have a reduced fibrinogenolysis activity and nonspecific plasminogen activation. The mutants can therefore be used for the lysis of fibrin clots without inducing systemic bleeding, as can be the case with the wild type protein. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                               described in AAR62992-K63008 were derived. These mutants retain the thrombolytic activity of the wild type protein, useful for the treatment of thrombolem, but have a reduced fibrinogenolysis activity and nonspecific plasminogen activation. The mutants can therefore be used for the lysis of fibrin clots without inducing systemic bleeding, as can be the case with the wild type protein. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                        9

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A portion of the A-chain (pref. amino acids 1-132) of pro-urckinase (AAR92926) can be linked to a drug, e.g. hirudin, somatostatin or their analogues (see also AAR929257-33) and used in the prodn. of new fusion drugs. The constructs can be obtd. by expression of the appropriate nucleotide sequences in transformed host calls. When administered to a patient, the A-chain binds the fusion drug to the platelet outer membrane, i.e. to the site of thrombosis or vascular injury. Cleavage sites for thrombin and/or plasmin with the fusion drug allow the release of the drug at the target site
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        targeted to
